Fatigue Management System

MasterSystem Technologies through its FleetMaster Division offers a Driver Fatigue Management Solution that identifies and notifies fleet managers of fatigue or distracted driving. The infrared driver facing camera works on a pupil identification technology to analyse the state of the driver and report on fatigue, distraction, intoxication and driver out of view.

Main Events Monitored

Fatigue or substance induced impairment.

Distraction or attention diversion.

Driver out of camera view.

Vibration Feedback

The driver feedback cushion sends vibrational stimulus to the driver when the fatigue camera detects a fatigue and distraction event.

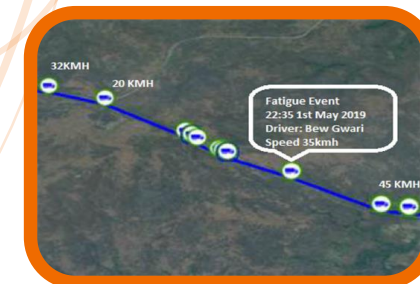

Event-Triggered Video

An added seeing eye camera supports the fatigue camera by capturing road and driver footage simultaneously when a fatigue or distraction event is triggered.

- In cab facing camera
- Road facing camera

Events Tracked in Real Time

Events are monitored and acted upon in real time with;

- Driver Information
- Vehicle Information
- Location
- Time & Date
